

## José went out into the forest and found 1 banana, 1 quetzal feather and 1 piece of obsidian

He figured that all of these were worth the same amount, so he offered the villager to trade 1 banana for a quetzal feather.

The villager got mad and threw his spear at José. Why on earth would he do that?

# Let's look at a graph that shows how many you found of each item on an average day 

Do you remember that "distribution" is how things are divided?

You can have a distribution like this that shows the number of each item found in the forest on an average day

This distribution shows how the items you found were divided among the four categories, cacao beans, bananas, quetzal feathers and salt.

## Another kind of distribution could show how often something occurs.

You went out in the rain forest looking for bananas on 11 different days. This table shows what you found:

| DAY | Number of Bananas |
| :--- | :--- |
| May $1^{\text {st }}$ | 25 |
| May $2^{\text {nd }}$ | 15 |
| May $3^{\text {rd }}$ | 1 |
| May $4^{\text {th }}$ | 39 |
| May $5^{\text {th }}$ | 20 |
| May 6 | 20 |
| May $7^{\text {th }}$ | 18 |
| May $8^{\text {th }}$ | 22 |
| May $9^{\text {th }}$ | 20 |
| May 10 | 18 |
| May $11^{\text {th }}$ | 22 |

You can look at the graph like this, but it doesn't tell you very much except how many bananas you found on a particular day.

## Number of Bananas

## How would a mathematician look at the distribution ?

First, make a table that shows how many days you found each number of bananas.

| Bananas Found | Number of Days |
| ---: | ---: |
| 1 | 1 |
| 15 | 1 |
| 18 | 2 |
| 20 | 3 |
| 22 | 2 |
| 25 | 1 |
| 39 | 1 |

When you graph this table, it is much easier to understand your distribution.

## Bananas Found

# You can see three things right away 

1. There was only one day that you found less than 15 bananas.

## Bananas Found

## 2. There were only two days that you found less than 18 bananas.

Bananas Found

Another way of saying that is that on 9 out of the 11 days, or $82 \%$ of the time, you found 18 bananas or more.
3. The most common number of bananas found in a day is 20 . On 3 days, you found 20 bananas.

## Bananas Found

When we talk about the AVERAGE DAY, like the number of bananas that you can expect to find in an average day ...
...... that doesn't mean you will find exactly 20 bananas every day.

Let's find the average of our distribution of days of banana gathering.

| Bananas <br> Found | Number of Days |
| ---: | ---: |
|  | 1 |

## First, we compute the total number of bananas found ...

Multiply the number of bananas by number of days we found that number .....

| Bananas <br> Found | Number of <br> Days | Bananas x <br> Days |
| :---: | :---: | :---: |
| 1 | 1 | 1 |
| 15 | 1 | 15 |
| 18 | 2 | 36 |
| 20 | 3 | 60 |
| 22 | 2 | 44 |
| 25 | 1 | 25 |
| 39 | 1 | 39 |

..... and then add that column.

| Bananas <br> Found | Number of <br> Days | Bananas $x$ <br> Days |
| :---: | :---: | :---: |
| 1 | 1 | 1 |
| 15 | 1 | 15 |
| 18 | 2 | 36 |
| 20 | 3 | 60 |
| 22 | 2 | 44 |
| 25 | 1 | 25 |
| 39 | 1 | 39 |
| TOTAL |  | 220 |

Second, we add up the number of days

| Bananas <br> Found | Number of <br> Days | Bananas $x$ <br> Days |
| :---: | :---: | :---: |
| 1 | 1 | 1 |
| 15 | 1 | 15 |
| 18 | 2 | 36 |
| 20 | 3 | 60 |
| 22 | 2 | 44 |
| 25 | 1 | 25 |
| 39 | 1 | 39 |
| TOTAL | 11 | 220 |

Third, we divide the number of bananas by the number of days

| Bananas <br> Found | Number of <br> Days | Bananas $x$ <br> Days |
| :---: | :---: | :---: |
| 1 | 1 | 1 |
| 15 | 1 | 15 |
| 18 | 2 | 36 |
| 20 | 3 | 60 |
| 22 | 2 | 44 |
| 25 | 1 | 25 |
| 39 | 1 | 39 |
| TOTAL | 11 | 220 |

220 Bananas
$=20$ bananas average per day 11 days

# If you didn't know, now you know 

## Another word for the "average" is

 "the mean"
# Still, why was the villager so angry with José ? 

The answer is, because he thought José was trying to cheat him.

On that one day that he went into the forest, José found 1 quetzal feather and 1 banana, so he thought they were of equal value.

However, on the average day, you would find 20 times as many bananas as quetzal feathers.

José missed the ideas of mean (average) and variability (that data points in a distribution can be different from one another).

He's lucky that the spear from the villager missed him!
